This is a special release for REtool (RCtool) made with FileMaker Pro Advanced 14

Installation

1) Unpack the archive and move the REtool work folder, a subfolder named 'REtool', without changing anything to your Mac. The location does not matter as long it is a folder which belongs fully to you, e.g. do not move it into the Applications folder. It is recommended to move the REtool work folder to a folder where you do your Review Editor work.

2) You need to add to the REtool work folder following files from the latest update from RCtool Home & Downloads:

 - REtool-main.fmpur (REtool work folder)
 - REtool-textlinks.fmpur (REtool work folder)

3) It is recommended to add also following files downloaded from the DMS to the dedicated subfolders in the REtool work folder:

- To work with the meta data add the text links spreadsheet for your draft to subfolder '0-TAT-textlinks' and import the meta data. If you can get from the DMS a 'REtool-textlinks.fmpur' that contains already all meta data you need, then simply replace the 'REtool-textlinks.fmpur' in your REtool work folder with the one downloaded from the DMS. Yet, it might not hurt to keep a copy of the spreadsheet with the text links in your subfolder '0-TAT-textlinks'. You may wish to import those data at some later point in time, e.g. into a new version of the 'REtool-textlinks.fmpur'.
- To jump to PDFs add the properly named PDFs as downloaded to subfolder 'pdfs' of the respective draft
- To import Review Comments add the comments spreadsheet as downloaded to subfolder 'z1-Review Comments'

Note: ZOD stands for Zero Order Draft (Internal Draft), FOD for First Order Draft, SOD for Second Order Draft, and FGD for Final Government Draft.

System requirements

This special release is offered for working with REtool (RCtool) on Macs using an older OS X. Following OS X are compatible:

    - OS X 10.9.5 (Mavericks)
    - OS X 10.10.5 (Yosemite)

plus

    - OS X 10.11.6 (El Capitan)

For older systems I recommend to use the special release for REtool (RCtool) made with FileMaker Pro Advanced 12. While this release works fine under OS X 10.11.6 (El Capitan) for the latter or newer systems I recommend to use the latest release.
